The present sequence is the antigenic epitope P545, derived from choptry associated protein-1 (RAP-1) of the asexual blood stage of properly associated protein-1 (RAP-1) of the asexual blood stage of properly decided protein-20 (MITMALVAC-1, which is a multivalent, multistage malarial protein CDC/VAITMALVAC-1, which is a multivalent, multistage malarial cacine or the recombinant protein comprises, melittin signal peptide, vaccine. The recombinant protein comprises, melittin signal peptide, vaccine or ircumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (CSP), sporozoite surface protein-1 (SSP-2), liver stage antigen-1 (CSP), merozoite surface protein-1 (SSP-2), liver stage antigen-1 (CSP), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/VAITMALVAC-1 vaccine has malarial infections. Anti-DCC/VIIMALVAC-1 antibodies can be used for malarial infections. Anti-DCC/VIIMALVAC-1 antibodies can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A non-dendritic peptide carrier (A) has been developed which is coupled through a linker to a solid phase, forming a complex of (A)-solid phase. Where (A) comprises 10-50 amino acids capable of forming a secondary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         T-cell stimulatory peptide; immunogen; non-dendritic; carrier; tumour; scaffold; inhibition; metastasis; wound healing; solid phase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Non-dendritic peptide carrier linked to a solid phase - useful as a diagnostic agent and as a scaffold for production of chemical
 Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of plasmodium falciparum life cycle
                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 41; DB 21; Length 8; 100.0%; Pred. The 5' ESTs different total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from ollgo-dT primed cDNA libraries. Such ESTs are not well sulted for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included 5' ESTs are derived from mRNAs with intext 5' UTR is rarely included 6' ESTs are derived from mRNAs with intext 5' UTR is are also used to obtain full length cDNAs and genomic changes. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 regulatory sequences and to design expression and secretion vectors.
Gene product may be isolated from a transformed E.coll (*11088) expression system using plasmid pmc9. and may then be used for immunisation against malaria. The product may also be used diagnostically to detect Abs directed against the parasite.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                            The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His) 6 tag, T-cell epitope from tetanus toxoid and 21 antigent epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LGA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBB-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of Plasmodium fallciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.
                                                                                                            Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of plasmodium falciparum life cycle -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antigenic polypeptide and DNA encoding it - having a determinant cross reactive with those on the rhostry organelles of the merozoite form of the malaria parasite P falciparum.

The present sequence is a polypeptide encoded by one of a large number of 5 ESTS derived from mRRAs encoding secreted proteins. The 5 ESTS of 5 ESTS derived from mRRAs encoding secreted proteins. The 5 ESTS of 5 ESTS are derived from 30 Gifferent tissues. EST sequences usually correspond mainly to the 3 of unitranslated region (UTR) of the mRNA because they are often obtained to include of primed CDNA libraries. Such ESTS are not well suited for isolating orDNA sequences derived from the 5' ends of mRNAs and even in the cases where longer CDNA sequences have been obtained, the full 5 of UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' UTR is rarely used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream chromosome mapping procedures. They are used to obtain upstream croulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids encoding 4277 human colon cancer-associated polypeptides,

AAY36754-Y37949 are encoded by open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, sapingitis, and perihepgritis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Hunthington's disease; haemostatic; amyotrophic lateral scleroslis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to human nucleic acids (AAI57798-AAI61369) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ren F, War

                                                                 AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens. The colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, therapy and vaccine production. N and P may be used in the prevention, cancer-sasion. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps. by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and AAB77789 represent sequences used in the exemplification of the

                                                                                                             28-MAY-1999,
    the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful immunosuppressant and cytostatic activity. The polynucleotide or polynucleotide or n gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous coft the invention may be used to treat diseases of the peripheral nervous coft system, such as peripheral nervous injuries, peripheral nervous such as contains nervous system diseases, such as lateral sclerosis, and Shy-Drager Syndrome. Other uses include the lateral sclerosis, and Shy-Drager Syndrome. Other uses include the cutilisation of the activity, chemotactic/chemokinetic activity, haemostatic cond thrombolytic activity, cancer diagnosis and therapy, drug screening, and thrombolytic activity, arthritis and inflammation, leukaemias and consistence of the screen of the state of the printed specification.
                                                                                                                                                                                                                  ,

```
The invention relates to human nucleic acids (AAI57798-AAI61369) and
the encoded polypeptides (AAAW8642-AAM42213) with nootropic,
the encoded polypeptides (AAAW8642-AAM42213) with nootropic,
cc the invention may be used to traat diseases of the peripheral nervous
cc f the invention may be used to traat diseases of the peripheral nervous
cc system, such as peripheral nervous injuries, peripheral nervopathy and
csystem, such as peripheral nervous system diseases, such as
localised neuropathies and central nervous system diseases, such as
cc lateral sclerosis, and Shy-Drager Syndrome other uses include the
lateral sclerosis, and Shy-Drager Syndrome other uses include the
cutilisation of the activity, chemotactic/chemokinetic activity, haemostatic
cc attriminibin activity, cancer diagnosis and therapy, drug screening,
and thrombolytic activity, cancer diagnosis and therapy, drug screening,
cc assays for receptor activity, arthritis and inflammation, leukaemias and
cc N.S disorders.
cc specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Wang D;
                                                                                                                                                                                                                                                       Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; CNS; Alzheimer's; parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Zhang J;

Required (for trans-golgi network-to-plasma membrane required for transport and a preferential target for GDP dissociation inhibitor.";

Mol. Biol. Cell 9:3241-3257(1998).

-I-FUNCTION: REGULATES THE GDP/GTP EXCHANGE REACTION OF MOST RAB PROTEINS BY INHIBITING THE DISSOCIATION OF GDP FROM THEM, AND THE SUBSEQUENT BINDING OF GTP TO THEM (BY SIMILARITY).

-I-SIMILARITY: BELONGS TO THE TCD/MRS6 FAMILY OF GDP DISSOCIATION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                   The present sequence is the antigenic epitope P604, derived from choptry associated protein-1 (RAP-1) of the asexual blood stage of proper protein and protein compared to the construction of recombinant protein CDC/VINIMALVAC-1, which is a multivalent, multistage malarial protein CDC/VINIMALVAC-1, which is a multivalent, multistage malarial protein CDC/VINIMALVAC-1, which is a multivalent, multistage malarial captiope from tetanus toxold and 21 antigenic epitopes from tetanus toxold and 21 antigenic epitopes concircumsporozoite protein (CSP-1), sporozoite surface protein-1 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (SSP-1), MSP-2, apical membrane antigen-1 (AM-1), erythrocyte binding caption-175, rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for
                                                                                                                                                                                                                                                                                                                                                            ;

The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant comprises, melittin signal peptide, (His)6 tag, Tr-call epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite from tetanus toxoid and 21 antigenic protein-2 (SSP-2), liver stage cortein (CSP), sporozoite surface protein-1 (MSP-1), MB-2, apical contigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MB-2, apical comborance antigen-1 (MAN-1), erythrocyte binding antigen-175 (BBA-175), Theoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of plasmodium falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting in falciparum in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The Ri gene is associated with paraneoplastic opsoclonus (PO). The DNA sequence encoding this polypeptide was isolated via an Ri clone, Ri8, which was isolated from a cerbellar cDNA expression vector library derived from antiserum from a single patient with PO. Phagemid was excised from lambda-Ri8 using the helper phage R408, the resulting

The allele, designated san5 or abi4-2, has a deletion of one of the three adenines at positions 277-279 relative to the wild-type allele (designated ABI4), which causes a change in the reading frame leading to a shorter, variant C-terminus from amino acid residue 44 onwards. The abi4-2 protein (AABB98925) does not contain the APETALA2 (AR2) domain located between residues 55-110 in the wild-type ABI4 protein (AAB98923) which mediates
plasmid being designated pRi8 (see also AAQ30801). pRi8 was cloned and propagated in E. coli. pRi8 encoded a protein of mol. wt. 40 kD which is recognised by anti-Ri antiserum. This Ri8 fusion protein was used as an antigen to affinity purify antibody from the anti-Ri antiserum. The DNA sequence of pRi8 was determined by the dideoxy method and an open reading frame encoding approx. 340 antino acids was identified. Regions of this sequence could be used to make PCR probes such that additional clones representing the full length Ri gene could be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New null allele of the Arabidopsis thaliana ABI4 gene, useful for imparting insensitivity to abscisic acid and ability to germinate and grow on saline soils \dot{}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ABI4 gene; transactivator; APETALA2 domain; AP2 domain; chromosome 2;
